1. Preparing environment

In order to build multi-platform applications using .NET on Linux, the first steps are for installing in our Linux machine the required tools.

We need to install .NET SDK from Microsoft and to allow us to develop easier, we will install an advance editor with a lot of features, Visual Studio Code from Microsoft.

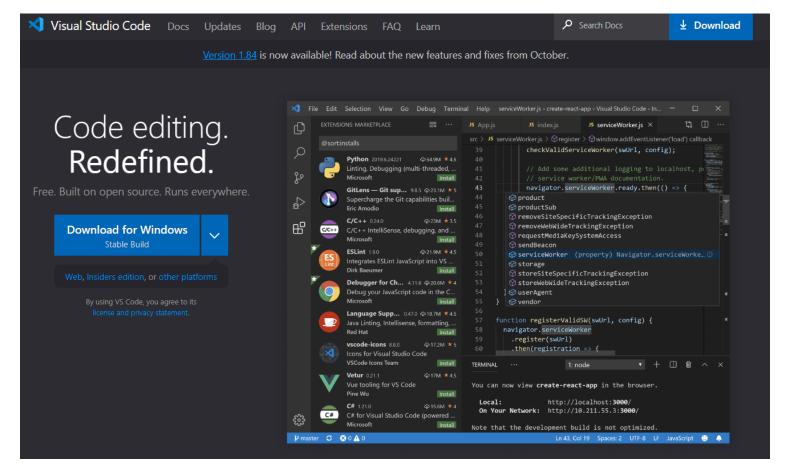

Both installations are very easy and the detailed description can be found by these two links: Install .NET SDK for Linux.

Install VS Code for Linux.

Once installed VS Code, you need to install a C# extension to facilitate us to code and debugging:

Install <u>C# extension</u>.

1.1. Check the installed Fonts availability

Check that the directory with fonts "/usr/share/fonts/truetype" is exist. Also check that it contains *.ttf files.

If you don't see this folder, you may install "Microsoft TrueType core fonts" using terminal and command:

\$ sudo apt install ttf-mscorefonts-installer

```
linuxconfig@linuxconfig-org: ~
All done, no errors.
Extracting cabinet: /var/lib/update-notifier/package-data-downloads/partial/verdan32.exe
                                                             IMUXCONFIG.O
  extracting fontinst.exe
 extracting fontinst.inf
  extracting Verdanab.TTF
  extracting Verdanai.TTF
  extracting Verdanaz.TTF
  extracting Verdana.TTF
All done, no errors.
Extracting cabinet: /var/lib/update-notifier/package-data-downloads/partial/webdin32.exe
                                                             LINUXCONFIG
  extracting fontinst.exe
 extracting Webdings.TTF
  extracting fontinst.inf
  extracting Licen.TXT
All done, no errors.
All fonts downloaded and installed.
Processing triggers for man-db (2.9.0-2) ...
                                                                       IFIG.ORG
Processing triggers for fontconfig (2.13.1-2ubuntu2) ...
linuxconfig@linuxconfig-org:-$
```

Read more about <u>TrueType Fonts and "How to install Microsoft fonts, How to update fonts</u> cache files, How to confirm new fonts installation".

In next paragraphs we will explain in detail how to create simple console application. All of them are based on this VS Code guide:

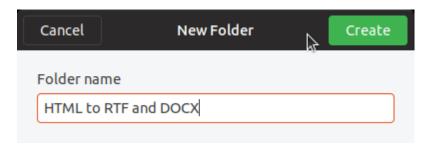

Get Started with C# and Visual Studio Code

Not only is possible to create .NET applications that will run on Linux using Linux as a developing platform. It is also possible to create it using a Windows machine and any modern Visual Studio version, as Microsoft Visual Studio Community 2022.

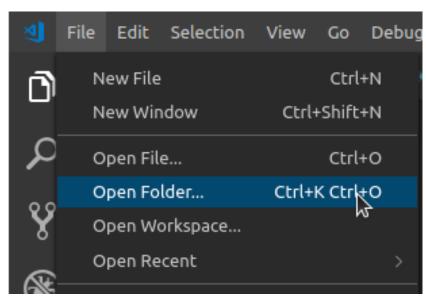

2. Creating "Convert HTML to RTF/DOCX" app

Create a new folder in your Linux machine with the name *HTML to RTF and DOCX*.

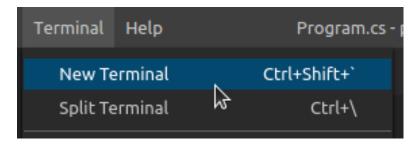

For example, let's create the folder "*HTML to RTF and DOCX*" on Desktop (Right click-> New Folder):

Open VS Code and click in the menu *File->Open Folder*. From the dialog, open the folder you've created previously:

Now, open the integrated console – the Terminal: follow to the menu **Terminal -> New Terminal** (or press Ctrl+Shift+'):

Create a new console application, using *dotnet* command.

Type this command in the Terminal console: dotnet new console

```
problems output debugconsole Terminal

jorgen@jorgen-linux:~/Desktop/HTML to RTF and DOCX$ dotnet new console
The template "Console Application" was created successfully.

Processing post-creation actions...
Running 'dotnet restore' on /home/jorgen/Desktop/HTML to RTF and DOCX/HTML to RTF and DOCX.csproj...
Restore completed in 418.49 ms for /home/jorgen/Desktop/HTML to RTF and DOCX/HTML to RTF and DOCX.csproj.

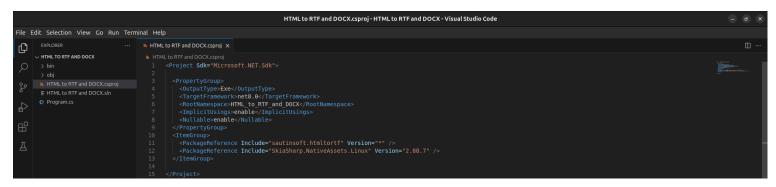

Restore succeeded.

jorgen@jorgen-linux:~/Desktop/HTML to RTF and DOCX$
```

Now we are going to modify this simple application into an application that will convert html file to rtf and docx files.

First of all, we need to add the package reference to the **sautinsoft.htmltortf** assembly using Nuget.

In order to do it, follow to the *Explorer* and open project file "*HTML to RTF and DOCX.csproj*":

Add these lines into the file "HTML to RTF and DOCX.csproj":

The first reference installs the latest version *sautinsoft.htmltortf* package from Nuget.

The second reference installs the *SkiaSharp.NativeAssets.Linux* package, which adds 2D graphics to .Net applications for Linux.

At once as we've added the package references, we have to save the "HTML to RTF and DOCX.csproj" and restore the added packages.

Follow to the *Terminal* and type the command: *dotnet restore*

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

root@jorgen-linux:~/Desktop/HTML to RTF and DOCX# dotnet restore
Restore completed in 94.06 ms for /home/jorgen/Desktop/HTML to RTF and DOCX/HTML to RTF and DOCX.csproj.
root@jorgen-linux:~/Desktop/HTML to RTF and DOCX#
```

Good, now our application has all the references and we can write the code to convert html to rtf and docx formats.

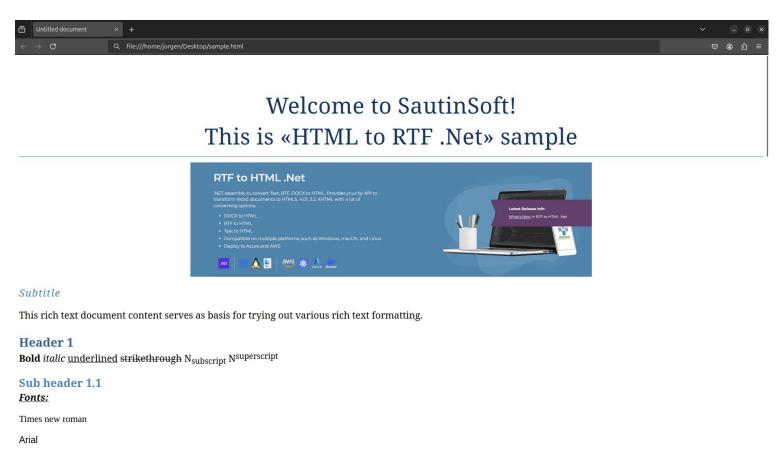

Follow to the *Explorer*, open the *Program.cs*, remove all the code and type the new:

The code:

To make tests, we need an input HTML document. For our tests, let's place the HTML file with the name "sample.html" at the Desktop.

If we open this file in the default HTML browser, we'll see its content:

Launch our application and convert the "sample.html" into "sample.rtf" and "sample.docx", type the command: **dotnet run**

The new files "sample.rtf" and "sample.docx" have to appear on the Desktop:

Open the results in LibreOffice:

Well done! You have created the "HTML to RTF/DOCX" application under Linux!

If you have any troubles or need extra code, or help, don't hesitate to ask our SautinSoft Team at support@sautinsoft.com!
